Supplementary Material

Estimates of Marijuana Use and Related Indicators — National Survey on Drug Use and Health, Colorado, 2002–2014

Suggested Citation: Alejandro Azofeifa, Margaret E. Mattson, and Rob Lyerla. Supplementary Material. State Level Data: Estimates of Marijuana Use and Related Indicators — National Survey on Drug Use and Health, Colorado, 2002–2014. Center for Behavioral Health Statistics and Quality. (2016). Substance Abuse and Mental Health Services Administration, Rockville, MD.

Notes: A) Two years of data were combined to allow for reliable state-level prevalence estimates. Some state-level prevalence estimates for combined years have been suppressed (indicated by an asterisk (*) symbol in each cell) based on the following National Survey on Drug Use and Health (NSDUH) suppression criteria. Prevalence estimates are suppressed if any of the following occurred: 1) the prevalence estimate is <0.005% or >99.995%; 2) the relative standard error (RSE) of the negative natural logarithm of (1-p) is >0.175 if the prevalence is ≤50%; 3) the RSE of the negative natural logarithm of (1-p) is >0.175 if the prevalence is ≤50%; 4) the actual sample size is <100; or 5) the effective sample size (defined as the actual sample size divided by the design effect) is <68.

B) The estimates provided in this supplementary material for each state and the District of Columbia are from design-based direct estimation procedures (i.e., they are based directly on the respondent sample and the accompanying analytical weights with variances derived through a Taylor-linearization approach using SUDAAN software) as used for the national level estimates (available at: Azofeifa A, Mattson ME, Schauer G, McAfee T, Grant A, Lyerla R. National Estimates of Marijuana Use and Related Indicators — National Survey on Drug Use and Health, United States, 2002–2014. MMWR Surveill Summ 2016;65(No. SS-11):1–25.

DOI: http://dx.doi.org/10.15585/mmwr.ss6511a1). Caution is advised when comparing data from other NSDUH reports that are based on different design-based estimation procedures.

C) Interpretation of state-level trend data should be done with caution as some prevalence estimates are suppressed based on the above criteria and survey cycle differences may not be statistically significant.

Abbreviation: CI = confidence interval.

^{*} Past month use of marijuana is defined as those who reported use of marijuana within 30 days preceding the date of interview.

1 Current employment and highest level of education completed are only defined for 18 or older.

2 "Other" employment category includes students, persons keeping house or caring for children full time, retired or disabled persons, or other persons not in the labor force.

Analysis limited to marijuana users (i.e., estimate of daily or almost daily use in the past year is among past year marijuana users; estimates of daily or almost daily use in the past month is among past month marijuana users).

Past year daily or almost daily use is defined as having used marijuana on 300 or more days in the past year.

Past month daily or almost daily use is defined as having used marijuana on 20 or more days in the past month.

Table 5. Percentage of past year marijuana initiation among persons aged ≥12 years at risk for initiation, estimated number at risk for initiation, and mean age at first use of marijuana among past year marijuana initiates, by age group — National Survey on Drug Use and Health, Colorado, 2002–2014

Perceived availability is defined as those who reported that it would be fairly easy or very easy for them to obtain marijuana if they wanted some

† Mode of acquisition is defined as those who reported how they got the marijuana they used for the last time [i.e., bought it, traded something for it, got it for free or shared with someone else, or grew it yourself]; this question is only asked of those respondents indicating use of marijuana in the past 12 months.
